Binding Quartz

Our Binding Quartz is a high-quality quartz silica additive designed for resin bound gravel installations, including driveways, pathways and patios.

Used as part of a resin bound system, Binding Quartz helps improve the strength and stability of the finished surface while supporting slip and skid resistance. Its translucent appearance helps preserve the natural colour of the decorative aggregate, avoiding the dull or sandy finish sometimes associated with traditional sand.

Why Use Binding Quartz

Improved Surface Strength

Helps reinforce the resin bound mix, contributing to a stronger and more stable finished surface.

Enhanced Slip and Skid Resistance

Adds fine quartz particles to the surface matrix, helping improve grip on paths, patios and driveways.

Clean, Natural Appearance

The translucent quartz blends discreetly into the mix, helping maintain the colour and finish of the chosen aggregate.

Reliable Workability

The semi-rounded 0.3–0.6mm grading supports consistent blending and ease of application during installation.

Binding Quartz

Size: **0.3–0.6 mm**

Rock Type: **Quartz Silica**

Shape: **Semi-rounded**

There is no substitute for quality and service
